

FR-D700 Series

Low cost micro VFD with Mitsubishi Electric quality.

- **Simple to use:** The FR-D700 is perfect for a wide range of applications
- **Simple to set-up:** The integrated digital setting dial with display makes configuration fast and easy
- **Simple operation:** Control remotely or with the built-in digital control
- **Simple to choose:** Low cost and with Mitsubishi Electric quality ensuring long operation life
- **Capacity:** From 1/8 to 20 HP
- **Safety stop function:** Meets EN954-1 Category 3 and IEC60204-1 Stop Category 0
- Integrated brake chopper circuit
- **MODBUS RTU:** Included as standard via the RJ45 port
- **150% torque at 1Hz and 200% torque at 3Hz** using General-purpose Magnetic Flux Vector Control
- **Optimum Excitation Control:** For increased energy savings when motor is not loaded
- **Frequency search function:** Catch a spinning load
- **Dancer control:** Allows position signal to control roll tension
- **Password function:** For parameter setting protection
- **Internal diagnostics function:** For monitoring status of critical components
- RoHS compliant
- 10 year maintenance free design

FR- 1 - 2 -NA

1 Max Load Capacity

Symbol	Voltage Class
D710W	1-phase 110V class
D720S	1-phase 240V class
D720	3-phase 240V class
D740	3-phase 480V class

2 Capacity

Symbol
Inverter capacity amperage / 10 (008 = 0.8A output)

FR-D700 General Specifications

Control Specifications	Control Method		Soft-PWM control/high carrier frequency PWM control (V/F control, General-purpose magnetic flux vector control, Optimum excitation control can be selected)	
	Output Frequency Range		0.2 to 400Hz	
	Frequency Setting Resolution	Analog Input	0.06Hz/60Hz (terminal2, 4: 0 to 10V/10bit) 0.12Hz/60Hz (terminal2, 4: 0 to 5V/9bit) 0.06Hz/60Hz (terminal4: 0 to 20mA/10bit)	
		Digital Input	0.01Hz	
	Frequency Accuracy	Analog Input	Within ±1% of the max. output frequency (25°C ±10°C)	
		Digital Input	Within 0.01% of the set output frequency	
	Voltage/Frequency Characteristics		Base frequency can be set from 0 to 400Hz. Constant torque/variable torque pattern can be selected	
	Starting Torque		150% or more (at 1Hz) when General-purpose magnetic flux vector control and slip compensation is set	
	Torque Boost		Manual torque boost	
	Accel. /Decel. Time Setting		0.01 to 3600s (acceleration and deceleration can be set individually), linear or S-pattern acceleration/deceleration mode can be selected.	
Braking Torque	Regeneration (*1)	FR-D720-008 and 014, FR-D720S-008 and 014, FR-D710W-008 and 014 ... 150%, FR-D720-025 and 042, FR-D740-012 and 022, FR-D720S-025 and 042, FR-D710W-025 and 042 ... 100%, FR-D720-070, FR-D740-036, FR-D720S-070 ... 50%, FR-D720-100 or more, FR-D740-050 or more, FR-D720S-100 ... 20%		
	DC Injection Brake	Operation frequency (0 to 120Hz), operation time (0 to 10s), operation voltage (0 to 30%) variable		
Stall Prevention Operation Level		Operation current level can be set (0 to 200% adjustable), whether to use the function or not can be selected		
Operation Specifications	Frequency Setting Signal	Analog Input	Two points Terminal 2: 0 to 10V, 0 to 5V can be selected Terminal 4: 0 to 10V, 0 to 5V, 4 to 20mA can be selected	
		Digital Input	Entered from operation panel and parameter unit. Frequency setting increments is selectable.	
	Start Signal		Forward and reverse rotation or start signal automatic self-holding input (3-wire input) can be selected.	
	Input Signal		Five points. You can select from among multi-speed selection, remote setting, second function selection, terminal 4 input selection, JOG operation selection, PID control valid terminal, external thermal input, PU-external operation switchover, V/F switchover, output stop, start self-holding selection, forward rotation, reverse rotation command, inverter reset, PU-NET operation switchover, external-NET operation switchover, command source switchover, inverter operation enable signal, and PU operation external interlock	
	Operational Functions		Maximum/minimum frequency setting, frequency jump operation, external thermal relay input selection, automatic restart after instantaneous power failure operation, forward/reverse rotation prevention, remote setting, second function, multi-speed operation, regeneration avoidance, slip compensation, operation mode selection, offline auto tuning function, PID control, computer link operation (RS-485), Optimum excitation control, power failure stop, speed smoothing control, MODBUS-RTU	
	Output Signal	Output Signal Points	Open Collector Output	One point
			Relay Output	One point
		Operating Status		You can select from among inverter operation, up-to-frequency, overload alarm, output frequency detection, regenerative brake prealarm, electronic thermal relay function prealarm, inverter operation ready, output current detection, zero current detection, PID lower limit, PID upper limit, PID forward/reverse rotation output, fan alarm (*3), heatsink overheat pre-alarm, deceleration at an instantaneous power failure, PID control activated, PID output interruption, during retry, life alarm, current average value monitor, remote output, alarm output, fault output, fault output 3, and maintenance timer alarm
		For Meter Output Points	Analog Output	0 to 10VDC: one point
	For Meter		You can select from among output frequency, output current (steady), output voltage, frequency setting, converter output voltage, regenerative brake duty, electronic thermal relay function load factor, output current peak value, converter output voltage peak value, reference voltage output, motor load factor, PID set point, PID measured value, output power, PID deviation, motor thermal load factor, inverter thermal load factor 0 to 10VDC	
Indication	Operation Panel Parameter Unit (FR-PU07)	Operating Status	You can select from among output frequency, output current (steady), output voltage, frequency setting, cumulative energization time, actual operation time, converter output voltage, regenerative brake duty, electronic thermal relay function load factor, output current peak value, converter output voltage peak value, motor load factor, PID set point, PID measured value, PID deviation, inverter I/O terminal monitor, output power, cumulative power, motor thermal load factor, inverter thermal load factor, PTC thermistor resistance.	
		Fault Definition	Fault definition is displayed when the fault occurs and the past 8 fault definitions (output voltage/current/frequency/cumulative energization time right before the fault occurs) are stored	
	Additional Display By The Parameter Unit (FR-PU07) Only	Operating Status	Not used	
		Fault Definition	Output voltage/current/frequency/cumulative energization time immediately before the fault occurs	
Interactive Guidance		Function (help) for operation guide		
Protective Functions		Overcurrent during acceleration, overcurrent during constant speed, overcurrent during deceleration, overvoltage during acceleration, overvoltage during constant speed, overvoltage during deceleration, inverter protection thermal operation, motor protection thermal operation, heatsink overheat, input phase loss (*5, *6), output side earth (ground) fault overcurrent at start (*5), output phase loss, external thermal relay operation (*5), PTC thermistor operation (*5), parameter error, PU disconnection, retry count excess (*5), CPU fault, brake transistor alarm, inrush resistance overheat, analog input error, stall prevention operation, output current detection value exceeded (*5), safety circuit fault		
Warning Functions		Fan alarm (*3), overcurrent stall prevention, overvoltage stall prevention, PU stop, parameter write error, regenerative brake prealarm (*5), electronic thermal relay function prealarm, maintenance output (*5), undervoltage, operation panel lock, password locked, inverter reset, safety stop		
Environment	Surrounding Air Temperature		-10°C to +50°C (14°F to 122°F) (non-freezing) (*4)	
	Ambient Humidity		90%RH maximum (non-condensing)	
	Storage Temperature (*2)		-20°C to +65°C (-4°F to 149°F)	
	Atmosphere		Indoors (without corrosive gas, flammable gas, oil mist, dust and dirt, etc.)	
	Altitude/Vibration		Maximum 1000m (3280.80 feet) above sea level, 5.9m/s ² or less at 10 to 55Hz (directions of X, Y, Z axes)	

Notes:

- The braking torque indicated is a short-duration average torque (which varies with motor loss) when the motor alone is decelerated from 60Hz in the shortest time and is not a continuous regenerative torque. When the motor is decelerated from the frequency higher than the base frequency, the average deceleration torque will reduce. Since the inverter does not contain a brake resistor, use the optional brake resistor when regenerative energy is large. A brake unit (FR-BU2) may also be used.
- Temperatures applicable for a short time, e.g. in transit.
- As the FR-D720-042 or less, FR-D740-022 or less, FR-D720S-042 or less, FR-D710W-042 or less are not provided with the cooling fan, this alarm does not function.
- When using the inverters at the surrounding air temperature of 40°C (104°F) or less, the inverters can be installed closely attached (0cm clearance).
- This protective function does not function in the initial status.
- This protective function is available with the three-phase power input specification model only.

CK-43-T	Conduit Kit for D710W-042 / D740-050/080	S

FR-D700 Dynamic Braking

All Mitsubishi Electric VFDs have some inherent braking capability. During controlled deceleration, motor regenerative losses are dissipated in the motor, wire, and VFD circuitry. The built-in DC injection braking allows for low speed braking and stopping.

When the above capabilities are inadequate for an application, it is necessary to add a power transistor brake unit and resistor unit in series across the DC bus. Motor regeneration causes the DC bus voltage to increase, and when the voltage exceeds a specified threshold, the transistor turns on to pass current through the resistor. Motor kinetic energy is converted to heat energy. VFD overcurrent and overvoltage protective circuits are active at all times, and will fault-trip the VFD if the brake size is inadequate.

Two main factors must be considered when sizing the brake, the effective duty cycle (%ED) and the short time duty rating. The effective duty cycle is increased when an external resistor is added. It is preferable to profile the effective duty cycle of the units of time. With this information, the short time duty is known and the %ED can be calculated, as shown in the below example.

$$\%ED = \text{Braking time} / \text{total time for complete operating cycle} * 100$$

Example: Complete cycle is:

- 5 sec: Acceleration time to reach set speed
- 60 sec: Run time at set speed
- 3 sec: Deceleration time to come to a complete stop
- 12 sec: Time period motor remains stopped

$$\%ED = 3 / (5 + 60 + 3 + 12) * 100 = 3.6\%$$

The tables shown assume 100% brake torque, when brake torque is represented by its percentage to the rated torque of the applied motor.

$$\text{Torque (kg.m)} = 974 * \text{Power (kW)} / \text{Speed (rpm)}$$

240VAC Dynamic Braking Resistor at 100% Braking Torque

Resistor Kit Model Number	Weight kg (lbs)	Resistance (Ohms)	Continuous Permissible Power (W)	Motor (Hp)	Drive Model		Stocked Item

General Notes:

- The amount of heat generated by the inverter is based on one inverter connected to one motor of the same capacity.
- The amount of heat generated in the above table is the amount of heat generated when the inverter is operated at its rated current.
- The amount of heat generated will decrease according to the motor load and usage (duty).

FR-D700 Standby Power

General Notes:

- The maximum is generated with PC terminal operating 100mA load, external parameter unit, and cooling fan operating.
- The minimum is generated with no load on PC terminal, no external parameter unit, and cooling fan off.
